黄纹妈竹 新栽培变种 图 1

Bambusa boniopsis McClure cv.

Yellow-stripe, cv. nov. Fig. 1

A typo distincta vaginis et aliquot culmi internodiis supra basin stramineo-striatis.

本栽培变种与妈竹不同之处在于箨鞘和秆基部以上数节的节间具黄色纵条纹。

China: Guangdong, South China Botanical Garden, Wang Runhui 113 (Typus IBSC).

This new cultivar is very attractive by the yellow stripes on basal culm internodes and is a potential ornamental bamboo for gardening and landscaping. It is a mutant plant from *B. boniopsis* and has been cultivated in South China Botanical Garden for about ten years and propagated for several times. The yellow stripes of culm seem to be a stable character.
